The Shielding Test Box for Wireless Equipment Product Line

The shielding test box is the necessary equipment for the manufacturer of the wireless product. Especially for the mass product line, the easy used and low cost shielding test box is necessary for the cost and efficiency consideration.

For the high frequency (900MHz, 1.8GHz, and 2.4GHz, even higher) wireless communication product, the size will become more and more compact. The reflection interference problem from the small shielding test box is more critical the low frequency product.

The figure shown is the small metal shielding test box , STBM-01, by **Perseus Tech. International Corp.**

which is well design and low cost for the testing requirement. The box is made by metal wall with absorber inside box. The figure shows the shielding test box for handset test at size 31cm(L) x 18cm(W) x 19cm(H). We also can make the shielding test box per customer required frequency.

On the other hand, we also can provide the even lower cost test box, STBP-01, which cost will be lower than the metal shielding box shown. But the size will be larger than metal shielding box.

For more detail, please contact us without hesitation.
